

Purpose: Instructions for setting up new company-issued hardware.

Section 1: Windows 11 Initial Setup

1. **Out-of-Box Experience (OOBE):** Power on your device. Connect to a secure Wi-Fi network. When prompted for a Microsoft sign-in, enter your corporate email address. This will automatically route you to our company's Single Sign-On (SSO) portal.
2. **Mobile Device Management (MDM):** Upon successful authentication, your laptop will automatically enroll in Microsoft Intune. Do not interrupt this process. It will deploy baseline security policies and install the Company Portal application.
3. **BitLocker Encryption:** Windows 11 BitLocker will silently encrypt your drive. You can verify this by searching for "Manage BitLocker" in the Start Menu. The recovery key is automatically backed up to your Azure AD profile.
4. **VPN Configuration:** Open the Company Portal app and install the Cisco Secure Client. Launch the client, enter `vpn.company.internal`, and authenticate using your physical security key or authenticator app.

Section 2: macOS Initial Setup

1. **Automated Device Enrollment:** Power on your Mac and connect to Wi-Fi. The setup assistant will notify you that the company manages this Mac via Jamf Pro.
2. **Authentication:** Log in using your corporate credentials. This provisions your local administrator account and begins pulling down baseline profiles.
3. **FileVault Encryption:** You will be prompted to enable FileVault. Click "Enable." The recovery key is automatically escrowed to our IT department. Do not skip this step.
4. **Self Service App:** Locate the "Self Service" application in your Applications folder or via Spotlight. This is where you will download approved software, including the corporate VPN client, without needing IT intervention.
