

Purpose: Maintaining a secure environment and accessing infrastructure safely.

Section 1: Zero Trust Network Access The company utilizes a Zero Trust architecture. Physical location does not grant implicit trust. All internal applications require authentication via our SSO provider, backed by mandatory Multi-Factor Authentication (MFA).

Section 2: AWS Cloud Access Access to AWS environments (Dev, Staging, Prod) is governed by strict Identity and Access Management (IAM) policies.

- **Access Requests:** Developers must request access to specific AWS accounts via the internal IT ticketing system.
- **Authentication:** AWS console and CLI access are brokered through AWS IAM Identity Center (formerly AWS SSO). Long-lived IAM user access keys are strictly prohibited.
- **Least Privilege:** Roles are provisioned with the minimum permissions necessary. For instance, developers building AI tools will be granted specific execution roles to interact with Amazon Bedrock, but will not have administrative IAM rights.

Section 3: Incident Reporting If you suspect a security incident, phishing attempt, or compromised credentials, immediately lock your machine and contact the Security Operations Center (SOC) hotline. Do not attempt to investigate the breach yourself.
